

AVENTX[®] Oracle Connector

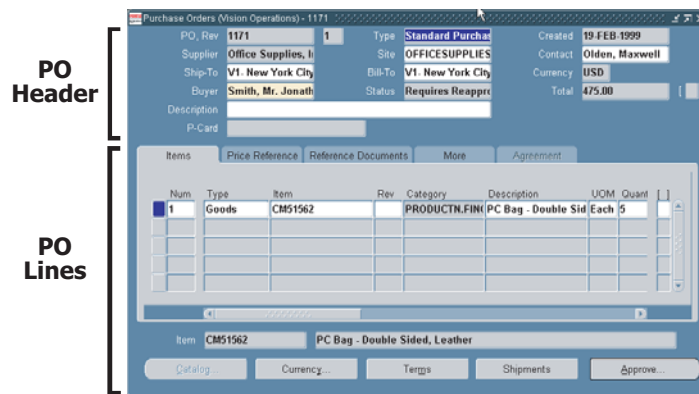

Flexibility, Invisibility, Improved Productivity, Cost-Effectiveness

Finding efficient ways to fax and email your critical documents from Oracle E-Business Suite is always a challenge. The seamless integration of AventX UNIX with Oracle E-Business Suite via the AventX Oracle Connector eliminates that challenge by providing users the flexibility to fax or email documents either automatically or interactively in full production mode.

The process is transparent and simple to execute, duplicating the standard steps for printing documents. User familiarity with printing procedures combined with the ability to check the status of document deliveries without ever leaving the Oracle environment improves productivity, saving time, money and manpower.

Support of Oracle Attachments

AventX Oracle Connector supports attachments for Purchase Orders, Requests for Quotation and Invoices in Oracle E-Business Suite 11i. Using standard Oracle functionality, you can attach any native file—PDF, Microsoft Excel spreadsheet, HTML, etc.—at the PO Header, PO Lines or Transaction level (for Invoices) for added flexibility.

Named Attachments for Email Delivery

AventX Oracle Connector will name your email attachments according to the documents you send. For example, an email with the subject "Invoice #1175" will have an attachment named "Invoice_#1175.PDF" or the like, depending on the file format.

Automatic Delivery

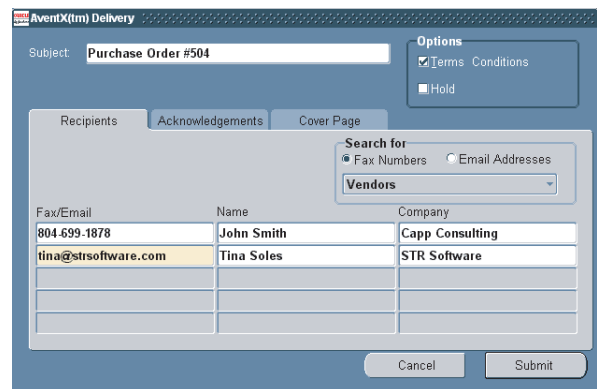

No user intervention is required to obtain the address and routing information for high volume, batch delivery of your A/R statements, purchase orders, invoices, order acknowledgements and requests for quotation. Plus, any other Oracle Report submitted through the Concurrent Manager can be configured by STR Software for batch delivery.

After users identify the report name and parameters, they simply select the appropriate print style (e.g. landscape or portrait) and AventX Automatic Delivery, then click the Submit button—just like printing a document. AventX Oracle Connector queries the applicable Oracle tables for the address information and submits the report output to AventX UNIX for delivery.

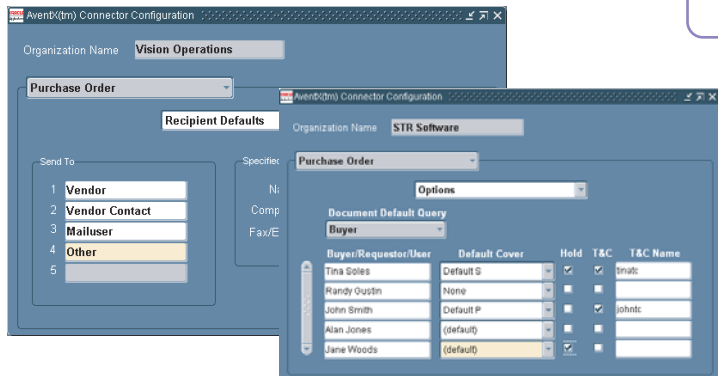

Interactive Delivery

You can send any document that you can print from Oracle, with the added flexibility to choose up to five (5) recipients and five (5) acknowledgement destinations. In addition, you can attach your choice of defined cover pages and/or terms and conditions, and apply hold attributes, as needed. After the user enters the variable information of choice, the document is submitted to AventX UNIX for fax or email* delivery.

*With the addition of AventX Mail or AventX Mail Plus option

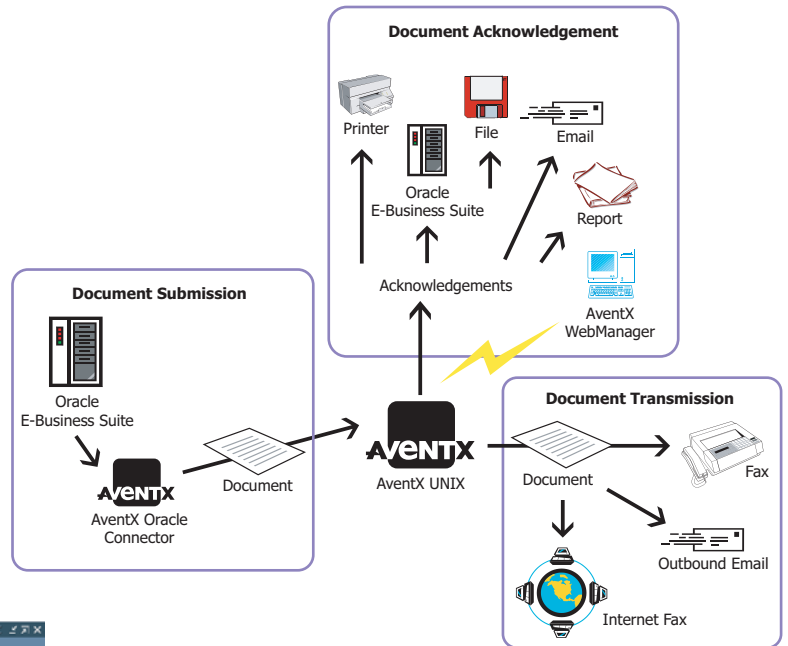

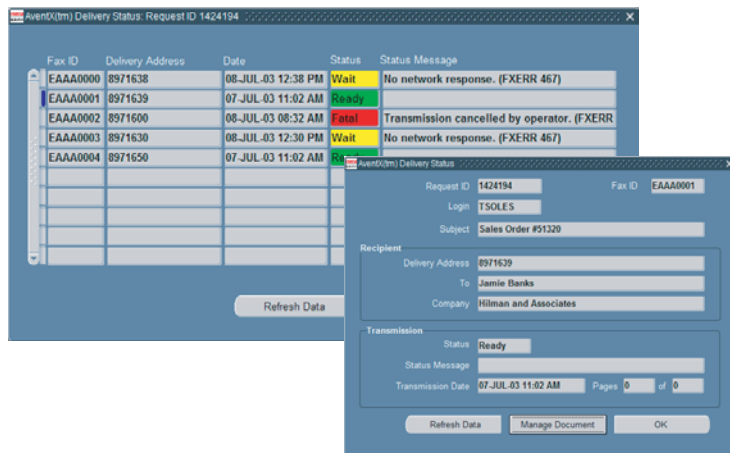

AventX Connector Configuration Form
Multi-organization corporations now have the ability to define specific defaults and business rules by document type for each division or subsidiary within the corporation. Standard recipients, acknowledgements, cover pages, terms and conditions, and hold attributes are configured initially, maximizing employee productivity.

AventX Delivery Status

Users may verify the delivery of their documents through the AventX Delivery Status form without ever leaving the Oracle environment. Available only with AventX Oracle Connector, the AventX Delivery Status form provides transmission information for each document associated with the specific Request ID. In the event of a failed transmission, full identification of the type of error encountered is also provided.

Information Delivery Management

Now fully integrated with AventX WebManager, AventX Oracle Connector lets you control the disposition of your documents, including holding, deleting and re-queuing them. Working in conjunction with AventX UNIX, AventX WebManager leverages the power of the Internet, allowing you to manage and monitor your documents from any Web browser.

System Information

Supported Oracle Versions

- 10.7 Character Mode
- 10.7 Smart Client
- 10.7 NCA
- 11.0
- 11i+

Supported Host Environments

- AIX
- HP-UX
- Intel Linux
- Solaris
- Tru64
